

AMENDMENTS TO THE CLAIMS

1. (Currently Amended) An information-recording apparatus for recording in an information-recording medium digital information on left and right frames for three-dimensional display, the digital information being acquired by shooting an object from the left and right at the same time, said apparatus comprising

a recorder for recording in the information recording medium said digital information for three-dimensional display with said digital information being alternately arranged at the left and right frames at a speed which is "n" times as high as the speed for recording digital information on one frame for normal display in units of an error correction configuration and an information recording format, which correspond to the digital information on one frame for the normal display

wherein said recorder modulates a servo control signal serving as a reference when said digital information for three-dimensional display is reproduced and records the modulated signal in said information recording medium.

2. (Cancelled)

3. (Original) The information-recording apparatus as claimed in claim 2, wherein said recorder modulates a waveform duty of said servo control signal according to the left and right frames of said digital information for three-dimensional display.

4. (Currently Amended) An information-recording method for recording in an information recording medium said digital information on left and right frames for three-dimensional display, the digital information being acquired by shooting an object from the left and right at the same time, said recording method comprising the step of

recording in the information-recording medium said digital information for three-dimensional display with said digital information being alternately arranged at the left and right frames at a speed which is "n" times as high as the speed for recording digital information on one

frame for normal display in units of an error correction configuration and an information recording format, which correspond to the digital information on one frame for the normal display

wherein a servo control signal serving as a reference during reproduction of said digital information for three-dimensional display is modulated, and the modulated signal is recorded in said information-recording medium.

5. (Cancelled)

6. (Original) The information-recording method as claimed in claim 5, wherein a waveform duty of said servo control signal is modulated according to the left and right frames of said digital information for three-dimensional display.

7. (Currently Amended) An information-reproducing apparatus for reproducing from an information-recording medium, digital information on left and right frames for three-dimensional display, the digital information being acquired by shooting an object from the left and right at the same time, said apparatus comprising

a reproducer for reproducing digital information on left and right frames for three-dimensional display by reading the digital information on left and right frames alternately out of said information-recording medium at a speed which is "n" times as high as a speed of reproducing digital information on one frame for normal display in units of an error correction configuration and an information recording format, which correspond to the digital information on one frame for the normal display,

wherein said reproducer reproduces a servo control signal serving as a reference when digital information for three-dimensional display is reproduced out of said information-recording medium.

8. (Cancelled)

9. (Previously Presented) The information-reproducing apparatus as claimed in claim 8, wherein said reproducer comprises judgment apparatus for detecting a waveform duty of the servo control signal reproduced by said reproduce, thereby judging a recording format of said digital information.

10. (Previously Presented) The information-reproducing apparatus as claimed in claim 8, wherein said apparatus further comprises a controller for detecting a waveform duty of said servo control signal and controlling said reproducer to reproduce the digital information on the right frame or the digital information on the left frame based on the waveform duty.

11. (Previously Presented) The information-reproducing apparatus as claimed in claim 10, wherein said controller executes dynamic tracking control for said reproducer to reproduce said digital information from said information-recording medium on a discrete one frame-by-frame basis.

12. (Currently Amended) An information-reproducing method for reproducing from an information recording medium digital information on left and right frames for three-dimensional display, the digital information being acquired by shooting an object from the left and right at the same time, said method comprising the step of

reproducing digital information on left and right frames for three-dimensional display by reading the digital information on the left and right frames alternately out of said information recording medium at a speed which is "n" times as high as the speed of reproducing digital information on one frame for normal display in units of an error correction configuration and an information recording format, which correspond to the digital information on one frame for the normal display;

wherein a servo control signal is reproduced serving as a reference when digital information for three-dimensional display is reproduced from said information-recording medium.

13. (Cancelled)

14. (Original) The information-reproducing method as claimed in claim 13, wherein a waveform duty of said reproduced servo control signal is detected to judge a recording format of said digital information.

15. (Previously Presented) The information-reproducing method as claimed in claim 13, wherein a waveform duty of said servo control signal is detected, and the digital information on the right frame or the digital information on the left frame is reproduced based on the waveform duty.

16. (Previously Presented) The information-reproducing method as claimed in claim 13, wherein dynamic tracking control is executed to reproduce said digital information from said information-recording medium on a discrete one frame-by-frame basis.

17. (Currently Amended) A computer-readable medium tangibly embodying computer-executable instructions, the instructions comprising instructions to:~~An information-recording medium having~~

~~recorded therein~~ record digital information on left and right frames, on the same or another computer-readable medium, for three-dimensional display;[[,]]

acquire the digital information ~~being acquired~~ by shooting an object from the left and right at the same time;[[,]]

wherein said digital information for three-dimensional display is recorded with said digital information being alternately arranged in the left and right frames at a speed which is "n" times as high as the speed of recording digital information on one frame for normal display in units of an error correction configuration and an information recording format, which correspond to the digital information on one frame for the normal display; and

reproducing a servo control signal which serves as a reference when digital information for three-dimensional display is reproduced from said information-recording medium.
